

Let's take a load off your upload.

File Upload Instructions

Viewpost supports two kinds of file transfer mechanisms:

- ✓ FTPS (FTP over SSL)
- ✓ SFTP (Secure Shell FTP)

Important

Prior to connecting to Viewpost FTP servers, please share the firewall changes in this table with your organization's firewall management team. They'll know what to do to help you successfully upload files.

Mechanism	Destination	Destination Port	Application
FTPS (explicit only)	104.219.228.6 upload.viewpost.com	Login: 21 Passive Data: 3000-3050	Login: ftp Passive data: ssl
SFTP	104.219.228.6 upload.viewpost.com	22	ssh

For SFTP, we also support and recommend public key-based authentication. Follow these three steps:

1. Generate and configure a public/private key pair on your host.
2. Perform a manual SFTP connection from the command line and enter your password.
3. Contact your Viewpost representative to enable the public key that was presented during Step 2.
4. (Optional) Point your test file to the test folder. Once ready for production, point to the inbox.
